

Leet Alert — product overview (PM handoff)

Purpose: Readable **single document** for product managers and stakeholders. Share `PRODUCT-PROTOTYPE.md` or the generated `PRODUCT-PROTOTYPE.pdf` (same folder). Regenerate the PDF after edits: from this directory run `npm run doc:pdf`.

Shipped UI: The running app must **not** show words like “prototype”, “draft experiment”, or lab badges — operators see a normal product. **Roadmap, fidelity, and wireframes live only in this repo** (`PRODUCT-PROTOTYPE.md` , `docs/product-prototype/visual-prototype.svg` , PDF). Cursor workspace rule `leet-alert-docs-with-app-changes.mdc` reminds every agent to update doc + visual + PDF whenever Alert app code changes (any chat).

App URL (production): `https://alert.theleetclub.com` (ingress subject to cluster config; confirm with engineering.)

Code: `monitoring-app/apps/alert-theleetclub-com/`

Visual reference (schematic, docs only)

Low-fidelity **SVG wireframe** (`visual-prototype.svg`) — **not** screenshots. It is **more detailed** than before: login, signed-in shell + Home, Red Flags (toolbar + compare strip + full column headers), Overall (fleet list), Admin (tabs + Machines panel + Team access editor concept).

Maintain: whenever routes or primary widgets change, edit `docs/product-prototype/visual-prototype.svg` , update this markdown if tables/copy shift, run `npm run doc:pdf` , commit `.md` + `.svg` + `.pdf` .

![Leet Alert visual reference - login, shell, Red Flags, Overall, Admin](docs/product-prototype/visual-prototype.svg)

Figures 0–4: Login; shell + Home destination cards; Red Flags (chips, compare presets, table columns); Overall; Admin (Machines vs Team access overview).

Relationship to the shipped UI

- **In the app:** no “prototype” / lab / draft wording in the UI — same Google sign-in, permissions, and data as operators expect.
 - **In this doc:** engineering/PM tracks **what is done vs evolving** (routes, KPI wiring, changelog). Treat **Known gaps** below as the “prototype roadmap” checklist, not terminology shown to users.
-

Who uses it

Audience	Typical need
Operators	See machines that need attention (Red Flags), fleet roll-up (Overall).
Alert admins	Machine profiles (workbook Admin tab), Who can use Alert (Leet Alert-only toggles), optional full Monitor grid, legacy cleaning rules.
Product / PM	Validate journeys, copy, and prioritization of screens.

Information architecture (routes)

Route	Name	What it is
/	Redirect	Sends signed-in users to Home .
/home	Home	Start screen: short intro and cards to Red Flags, Overall, and Admin (if allowed).
/red-flags	Red Flags	Machines currently failing checks; reasons column; compare date controls for future KPI wiring.
/overall	Overall	Full machine list and fleet-oriented view; KPI/compare detail evolves with data connections.
/admin	Admin	Tabs: Machines (xlsx Admin columns), Who can use Alert (steps 1-2 Leet Alert access; step 3 full Monitor JSON), My access , Advanced (substring cleaning).
/login	Login	Google sign-in; unauthenticated users only.

Permissions (plain language)

Access comes from the **same dashboard-access rules** as Monitor (`people-api`).

Approximate mapping:

- **View Leet Alert** — can open Red Flags and Overall.
- **Manage Leet Alert settings** — can open Admin (machines, own access view; team editing only with org admin).
- **Org access admin** (Monitor “admin” capability) — can use **Who can use Alert** in Admin to add/remove Leet Alert access and open the full permission grid (step 3) when needed.

If someone can sign in but sees **No access**, they need a colleague with team-access rights to grant Leet Alert visibility.

Data behavior

- Client polls/refetches on the order of **about one minute** for snapshot lists unless the user clicks **Refresh now**.
- Red Flags content reflects API `/api/alert/red-flags/snapshot` (machines with active reasons).
- Overall lists machines from `/api/alert/machines` .

Deploy & operations

- **Image:** `programmeradmin25/alert-theleetcub-com:latest`
- **Kubernetes:** Deployment `alert-app` , namespace `leet-monitor` , label `app=alert-app`
- **Manifests:** `apps/alert-theleetcub-com/k8s/app.yaml` , `ingress.yaml`

Engineering runs from WSL: `npm run build` (optional local check), `docker build + docker push` , `kubectl rollout restart deployment/alert-app` , then verify pods (see repo deploy rule).

Known gaps / not final (check with engineering)

- **Admin** sheet fields are reflected in the **Machines** tab (machine, owner, hours, days, cleaning, operators, technician/QA JSON). **Red Flags / Overall** workbook tabs list many more KPI columns (attendance, promotions, wastage, ...) — those roll out as APIs and queries land; compare presets are wired in UI ahead of full metrics.
- Compare presets and KPI columns: UI is present; **full metric parity** depends on finalized data wiring from reporting/spec.
- Copy and visual hierarchy are tuned for operators; **final marketing naming** may differ.

Changelog (keep this section updated)

When you change routes, permissions behavior, major copy, or roadmap items in **Known gaps**, **add a row** (newest first).

Date (UTC)	Summary
2026-05-01	Admin tab Who can use Alert : dedicated shell + steps 1-3 (Leet Alert-only vs full Monitor grid); Machines aligned to xlsx Admin tab + <code>docs/alert-workbook-admin-tab.md</code> ; tab subtitles; PRODUCT doc updated.
2026-04-30	Home hub (<code>/home</code>), sidebar hints; Team access in Admin; operator-facing copy on Red Flags / Overall.
