Leet Alert — product scope (PM / PO)

App: alert.theleetclub.com · **Repo:** `apps/alert-theleetclub-com/`
Refresh PDF: `npm run doc:pdf` (commit md + `figures/wire-*.svg` + `PRODUCT-PROTOTYPE.pdf`). Shipped UI has no “prototype” wording — wireframes are documentation only.

Routes & capabilities

Route	Area	What users get
`/`	Entry	Redirect to **Red Flags** (no Home tab).
`/login`	Login	Google sign-in.
`/red-flags`	Red Flags	Compare presets; table + cards; toolbar **machine search** + **Risk sort** + **Sales sort** + **Hide inactive**. **Op. hours** column (Admin hours/days/owner). **Fleet revenue** bar: preset totals + **MTD vs last MTD** + **YTD vs LY** + short as-of stamp. **Live operator** — Task Manager name + attendance badge; **one tap** → schedule + icon-only contacts. **Last** / **tx** — 3-line stamp; highlight when no sales ≥4h. **Downtime** — Today mins + period + trend %; tap → projected loss (**5-min grace**, peak bands). **Last clean** — last GC + next window / days left. **Credits sent** — tap → scrollable popup led by **est. lost revenue** (tests/refunds/unidentified) + WEB cashless breakdown. **Top** / **low drink** — highest/lowest SKU; tap → top 5 + lowest 5 names. Sales / Target / SX / **Technical** (was Trend) / QA; **QA Visit popup** includes Admin / Findings / Report plus **Issue frequency** (same finding × count across inspections in the date range, with occurrence dates). Fleet bar Yest. full day / –2d.
`/overall`	Overall	Workbook columns; toolbar **machine search** + **Risk sort** + **Sales sort** + **Hide inactive**; **sortable headers**; **Operator Activity**; **Downtime** (Today mins · period · trend %; loss after 5-min grace); **Last clean** next window / days left; **Last** / **tx** no-sales ≥4h highlight; **Attendance** from Task Manager; **Sales** daily-elapsed presets; **Customer calls** column reserved (no API yet → —).
`/qa-visit`	QA Visit	**Standalone ops tab:** fleet overview with **date range** + **searchable machine dropdown** → machine workspace (filters carry over), KPI strip, trend, history, findings tabs, PDF. Separate from Red Flags cell popup.
`/performance`	Performance	**Location** | **Products**. Location: fleet combined strip + fleet-wide combined line (default on) + weekly presets. Products: select **all** locations/drinks (graphs page 8); mix basis **Actual revenue** | **+ WEB cashless**; brief strip **Actual + WEB cashless = Total income** with mix bar.
`/footfall` · `/v2/footfall`	Footfall	Same Targets graph stack as target.theleetclub.com: heatmap + hourly footfall/conversion/revenue/gap chart + trajectory. **Period A** / **Period B** date bar drives report; KPI cards = Period A; **Period A vs Period B** section shows totals Δ + daily/hourly charts. Default **As measured** (camera only). **Mirror & adjust** opt-in. Admin → Targets override daily KPIs.
`/promo` · `/v2/promo`	Promo	**Campaign cups** by location: date range → daily achieved/remaining bars (default product **Americano Max**). Same `target_promo_*` tables as Targets site. Configure under **Admin** → **Promo** (not Admin → Targets). Swipe instruments still on Performance + Area owners / Promo admin.

Route	Area	What users get
`/admin` → Targets	Admin · Targets	**Searchable** machine pick (single + bulk multi). Location target once (KD or cups); **bulk-apply location target** to many machines (products unchanged). Promote **1..N Vendon products** per location, each with its own target. Fleet table = **one row per location** (expand for products). Cached sales **insights** on hover-click.
`/admin` → Promo	Admin · Promo	Product assignment (owner or **searchable** machine) from **Vendon product dropdown** (same catalog as Targets; loads on open, refreshes when machine/owner changes), calendar **day cup targets** with searchable multi-machine pick, swipe instrument names. Separate from KD/SX Targets.
`/v2` … `/v2/*`	**Alert v2**	Pure Manus **Fleet Intelligence** UI with **full Classic workbook fields** (Red Flags / Overall / QA / Performance / Footfall / Promo) in Manus tables/cards — no Classic Stitch chrome. Classic + Pro at `/`. Login `/v2/login`.
`/admin`	Admin	User-entered data **not on Vendon**. **Machines** (**searchable** Vending machine pick, cleaning, operators, hours), **Targets**, **Promo**, **Area owners** (filter machines), **QA visit** (searchable machine), **Who can use Alert**, **My access**, **Advanced**.
`/constellation-taxonomy-hud.html`	Constellation HUD	Outer-space **taxonomy** drill-down: Kuwait → brands (Leet / EE / Park) → geographic areas → machines → Revenue / Stock / Contract. Same-origin people-api proxies only (no browser→Vendon/Workflow): machines, red-flags snapshot, sales elapsed/summary, last-tx, live-dashboard, downtime + Workflow attendance/cleaning/tech maps + focused operator-schedule. Machine detail **VENDON STATUS** | **WORKFLOW** | **REVENUE**. **Assign via Workflow** posts GO CHECK / DM / cleaning-overdue. Requires session on **https://alert.theleetclub.com**. `file://` → DEMO + banner (no fetch).

Permissions (summary)

people-api rules (same store as Monitor): view → Red Flags + Overall + **QA Visit** + **Performance** + **Footfall** + **Promo**; **leetAlertAdmin** → Admin and edit **Who can use Alert** (same session rules API as Monitor **admin**); optional Monitor grid in **Advanced**. Adding people is limited to your Google Workspace domain(s): env `ACCESS_ALLOWED_EMAIL_DOMAINS` / `DASHBOARD_ACCESS_EMAIL_DOMAINS`, else the signed-in admin's domain. No entitlements → **No access** after sign-in until an admin grants access.

Visual UI prototype (figures 0–4)

Aligned with current React shell (`App.tsx`), Home ("Choose a workspace"), and Admin vertical sections (`AdminPage.tsx`).

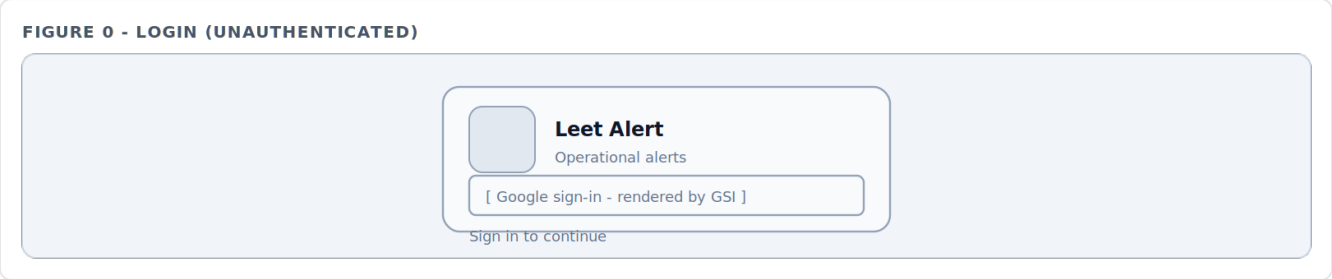

Figure 0 — Login

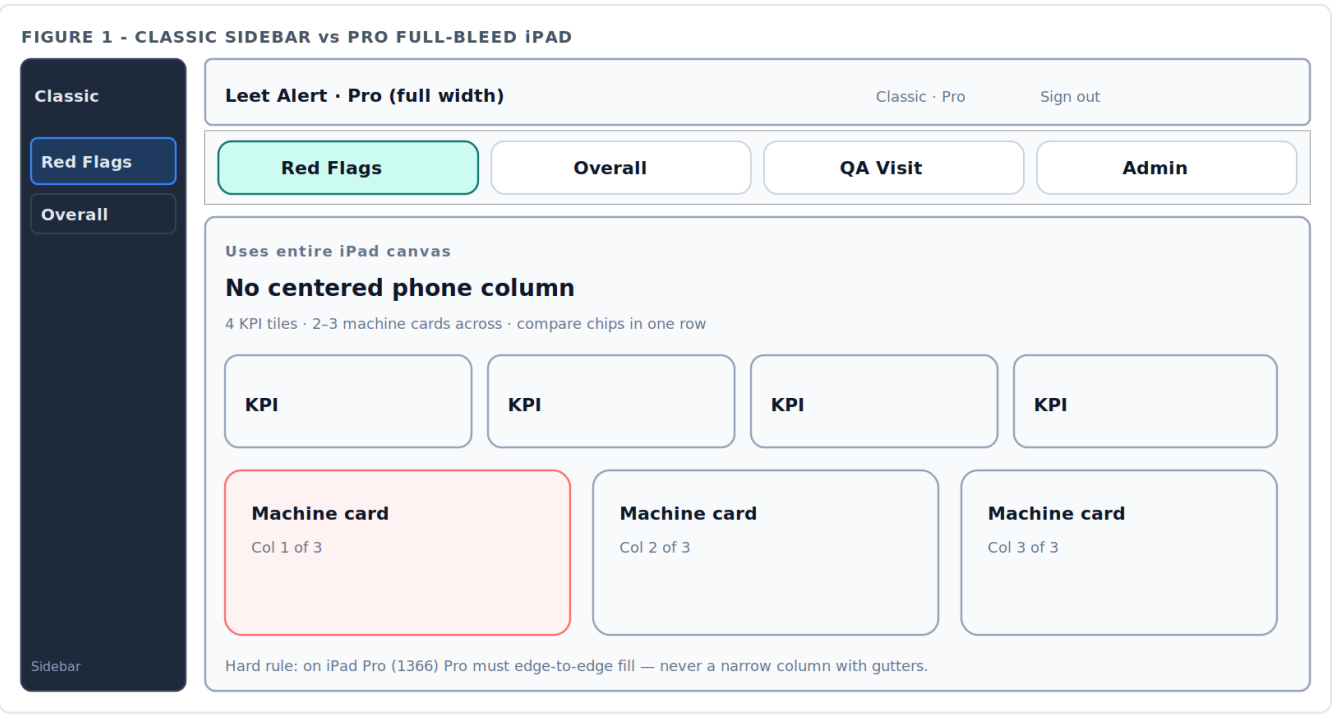

Figure 1 — Classic: coral Stitch sidebar. Pro: light iPad tab strip (unchanged). v2 (`/v2`): Manus Fleet Intelligence pages — separate from Pro (see figure 7).

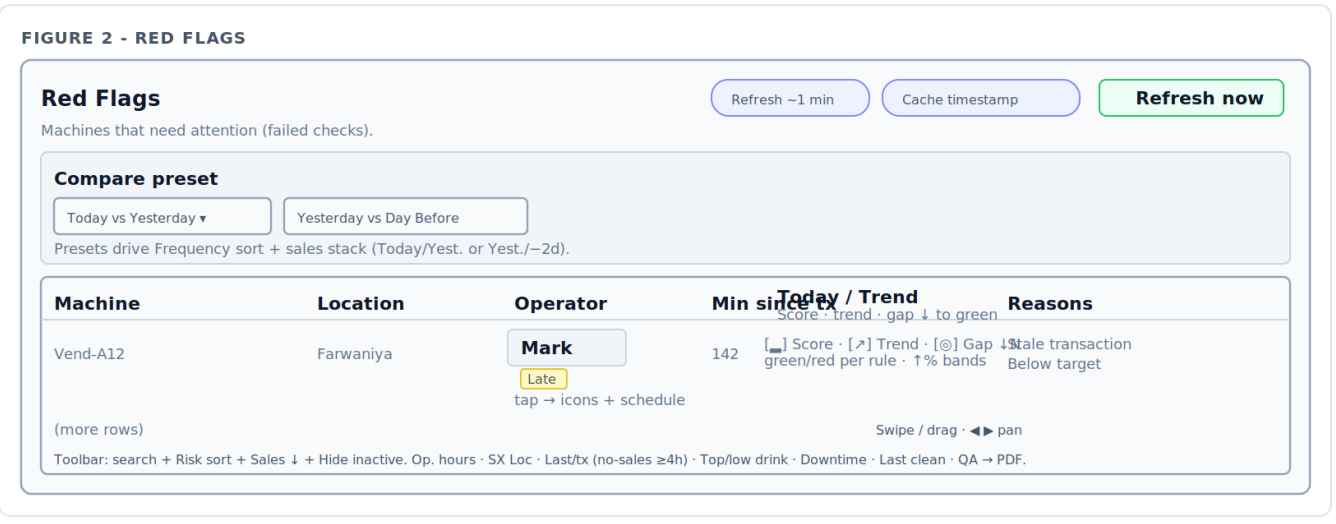

Figure 2 — Toolbar, compare preset, table.

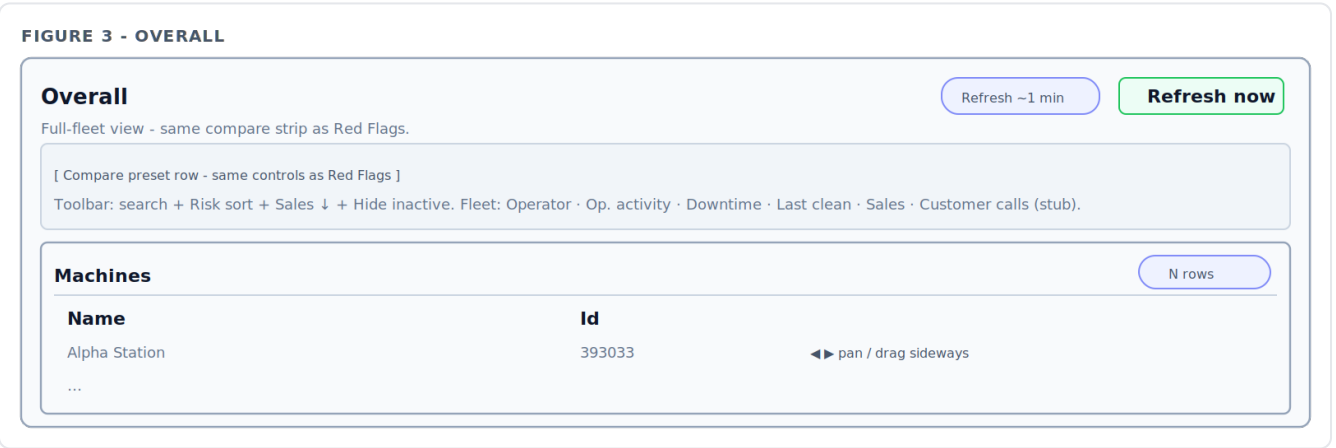

Figure 3 — Same compare pattern; fleet table.

FIGURE 4 - ADMIN (VERTICAL SIDEBAR / ADMINPAGE.TSX)

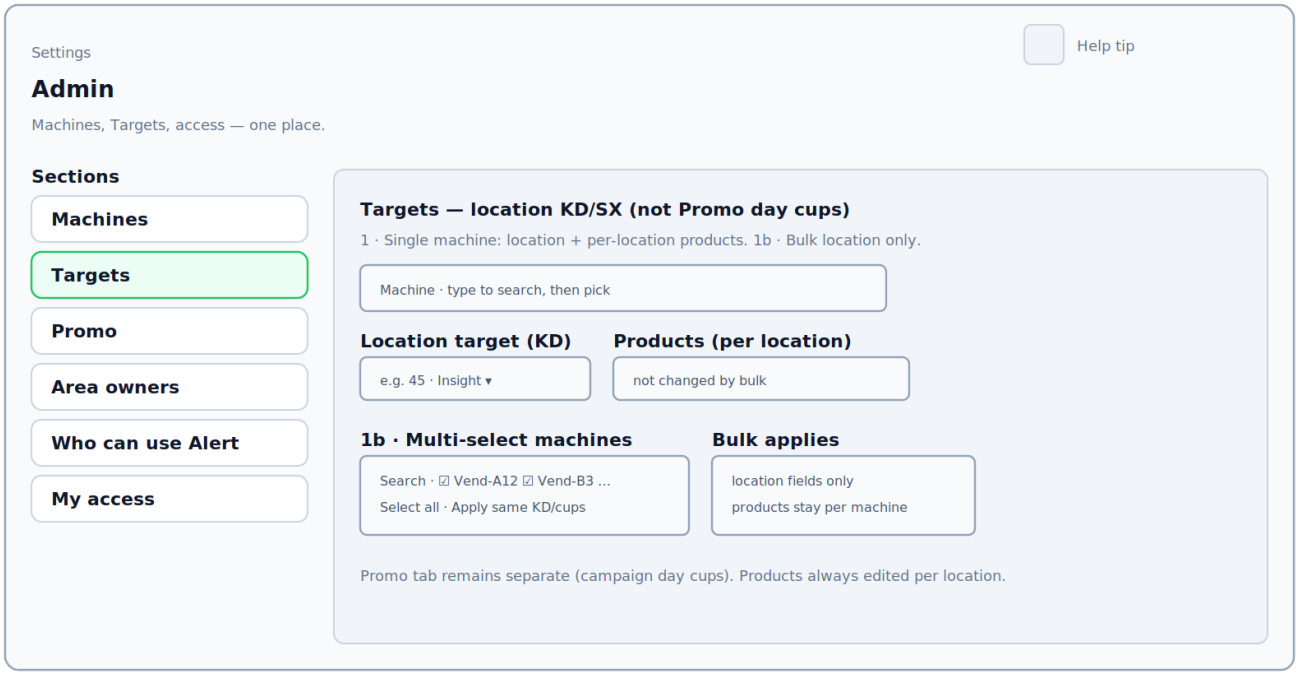

Figure 4 — Settings header; Sections sidebar includes Targets (location KD + SX product) separate from Machines.

FIGURE 5 - QA VISIT (OPS DASHBOARD)

Figure 5 — QA Visit fleet / machine workspace.

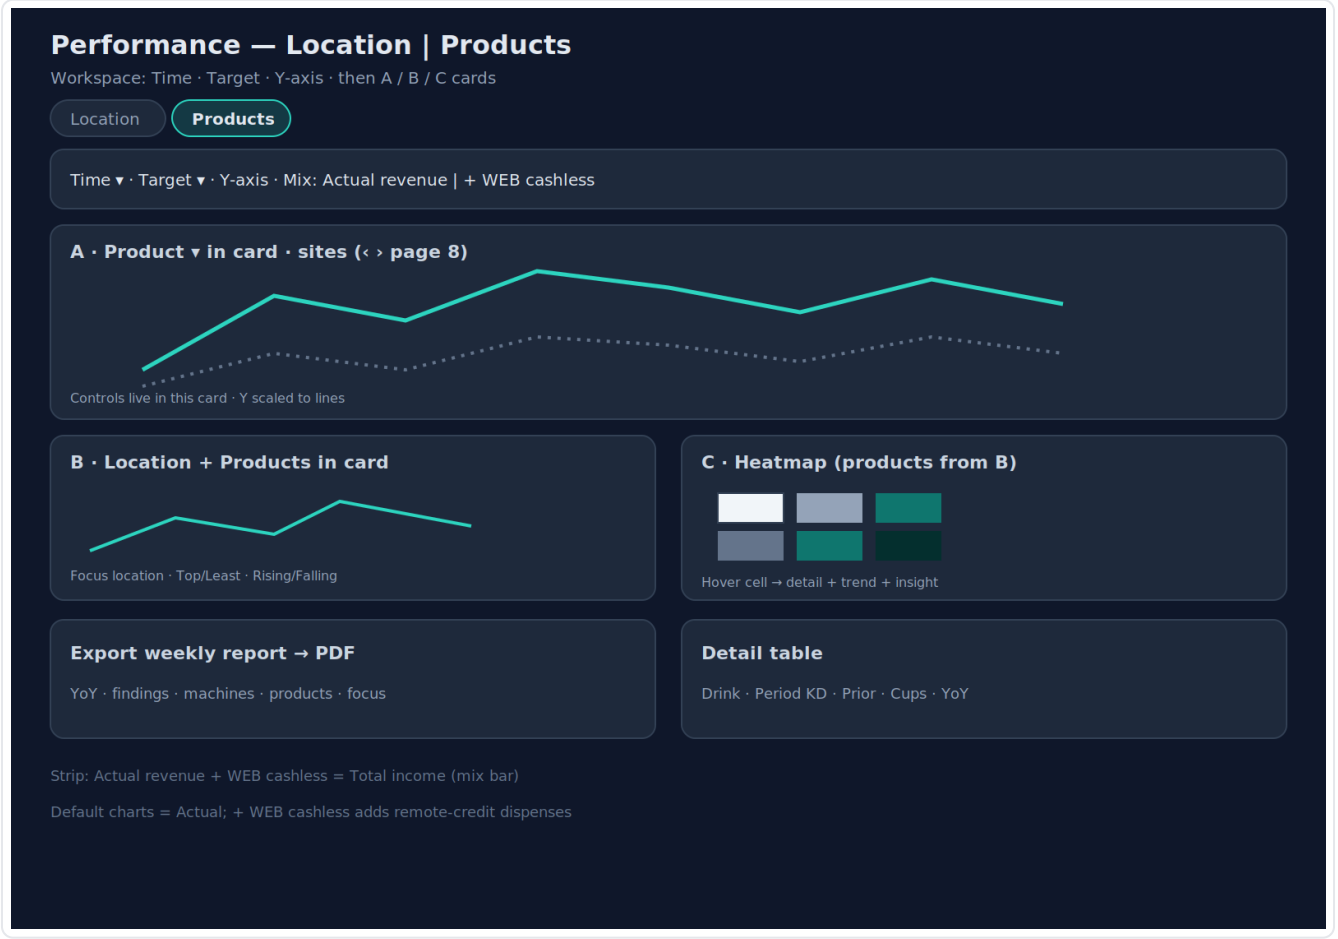

Figure 6 — Performance Products: mix basis Actual / + WEB cashless · Actual + WEB = Total strip · Graph A/B/C · PDF weekly export.

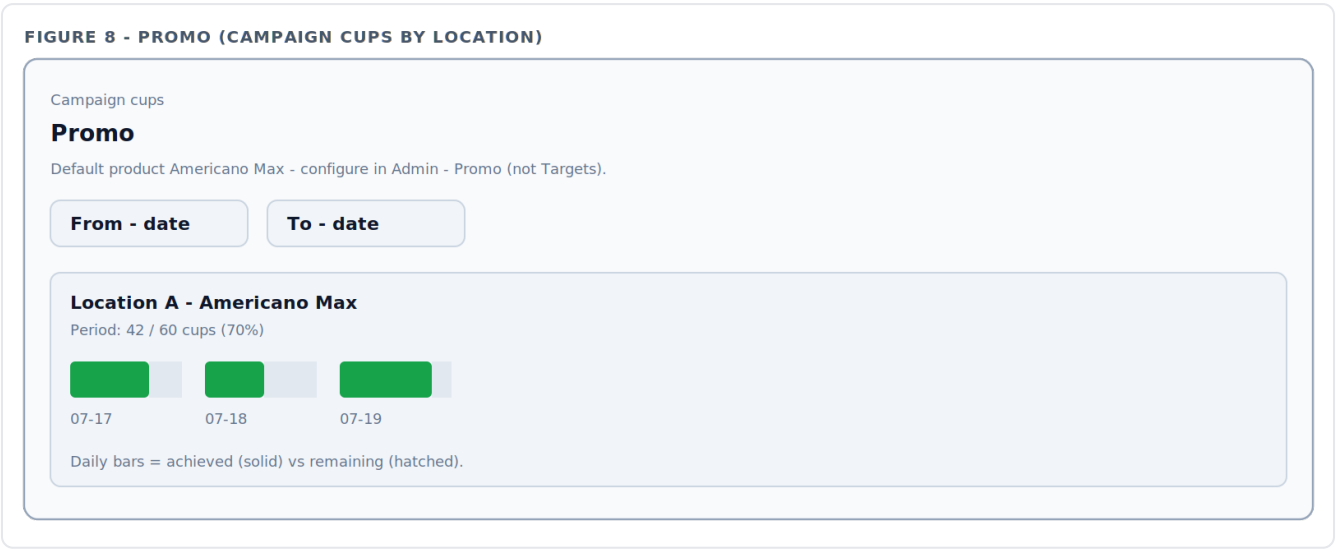

Figure 8 — Promo: date range + location cup bars (Admin → Promo configures targets).

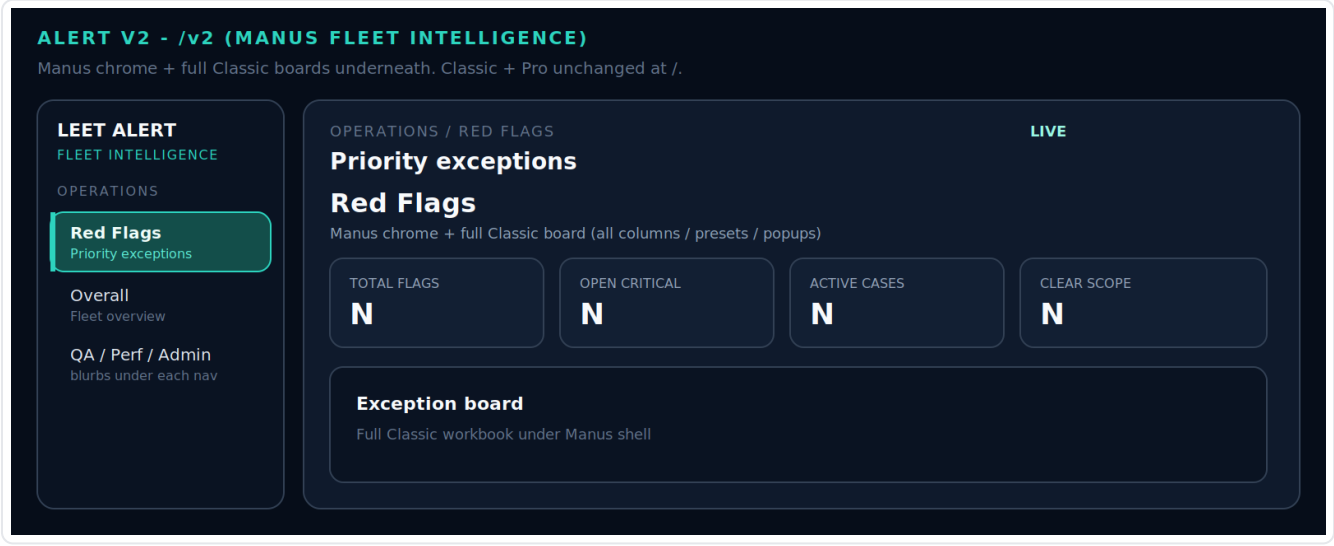

Figure 7 — Alert v2 (`/v2`): Manus Fleet Intelligence chrome + full Classic boards underneath. Not Pro.

Composite SVG (all panels): `docs/product-prototype/visual-prototype.svg`

PO quick facts

- Lists refetch ~**1 min**; **Refresh now** on each screen.
- Admin order: **Machines** → **Targets** → **Promo** → **Area owners** → **QA visit** → **Who can use Alert** → **My access** → **Advanced** (team tab only if org admin).

Constellation / taxonomy HUD — why it exists

Standalone page at `/constellation-taxonomy-hud.html` (not Classic/Pro/v2 nav). **Alert-hosted prototype** for a future **end-user** constellation product — not the fleet-ops pipeline mesh.

1. **Decision UX** — Spatial drill-down (Kuwait → brand → area → machine → Revenue/Stock/Contract) makes “where to act” faster than dense tables alone; focused vitals (today KD, flags, cleaning overdue, operator) surface the next move.
2. **Gamified attention** — Mild “ops focus” scoring from live tier-1 / overdue / flag load keeps operators locked on clearable work (focus → output).
3. **Timing** — AI visualization gimmicks are peaking in consumer feeds; shipping a live ops version now is cheap initiative before a formal ask.
4. **Prototype → product** — Prove taxonomy + Workflow assign here on Alert; later spin the same mental model into an end-user experience elsewhere (consumer/partner surfaces), keeping Alert as the ops lab.

Planned additions (roadmap)

Full spec: `ALERT-ROADMAP.md` (2026-06-17 PM intake).

Area	Summary	Status
QA column	Last visit + **score chip**; **QA Visit tab** for full fleet/history/filters/trend/PDF;	**Shipped** — `/qa-visit` + `GET /api/alert/qa/machine-audits`

Area	Summary	Status
	cell popup = full modal (unchanged)	
Target column	Beside sales: today % + remaining; popup WTD vs prior week	**Shipped** — snapshot `dailyTarget` + area-owner box + `GET /api/alert/targets/machine-detail`
Cleaning 15h alert	Overdue-not-cleaned notification + red-zone UI	**Shipped** — `cleaningOverdue15h` red row; banner + optional browser notification; alert icon opens message modal — **Workflow channel can POST cleaning-overdue** to operator inbox; Slack/Email/WhatsApp remain copy
Sorting	Sales today/month; QC latest/oldest	**Shipped** — Data columns sortable (⇅/▼/▲, third click clears); **Live operator** and other action-only columns excluded; **Last** / **tx** uses Vendon ISO timestamp
Operator last access	Last door open / machine access time	**Shipped** — **Operator Activity** column (`operatorLastAccessAt`); Live operator column = **name box + attendance badge only** (contacts in modal icons)
Tech visit	Workflow QC last visit (fallback SafetyCulture) + Admin-assigned tech + on-site proof	**Shipped** — `GET quality-control` via people-api; SC fallback; Admin Vendon tech schedule; drink tests + Monitor presence
Leet Workflow — Attendance	Task Manager schedule + punch status on Overall + Red Flags	**Shipped** — active schedule period → operator per machine; badge (Late yellow / Absent red / **Missing** when not scheduled); tap opens MTD modal (`operator-schedule`) **plus Monitor physical location** (Attendance & Cleaning proven credit, 21d + modal self-fetch); fleet map fetched in **batches of 24** machine IDs
Leet Workflow — other	Cleaning, GO CHECK, Call OP DM, tech visit	**Shipped writes** — GO CHECK → `POST /tasks/urgent-operator` (Slack fallback); Call OP → `POST /direct-messages` ; cleaning overdue → `POST /notifications/cleaning-overdue` ; tech visit modal → QC list

Changelog

Date (UTC)	Summary
2026-10-14	**Constellation HUD tidy rings (`BUILD: 20261014-layout-tidy`):** Concentric level rings (region→brand→area→machine→facet) with √machine angle weights — stops product-leaf inflation that piled Leet into a messy tangle. Softer edges, zoom-gated labels, fit scales for larger rings. Hard-refresh: `https://alert.theleetclub.com/constellation-taxonomy-hud.html?v=20261014-layout-tidy` .
2026-10-14	**Constellation HUD instant demo tree (`BUILD: 20261014-layout-fast2`):** On live boot, paint mock taxonomy in the first frame so the tree is never blank while APIs crawl. Phase 1 (machines+snapshot) races a ~4s timeout — on timeout keep the demo tree and finish live skeleton/enrich in the background. Leaf-weighted layout retained; downtime stays soft-fail (never blocks paint). Hard-refresh: `https://alert.theleetclub.com/constellation-taxonomy-hud.html?v=20261014-layout-fast2` .
2026-10-14	

Date (UTC)	Summary
	Constellation HUD faster paint + spread layout (`BUILD: 20261014-layout-fast`): Leaf-weighted radial layout so Leet (large fleet) gets a wide arc instead of stacking machines in one corner; larger base radius. Two-phase load: machines+snapshot paint first, then enrich (downtime soft-fails — was 500 under Postgres connection-slot pressure). people-api downtime path degrades when cache/cleaning DB is unavailable. Hard-refresh: `https://alert.theleetclub.com/constellation-taxonomy-hud.html?v=20261014-layout-fast` .
2026-10-14	**Constellation HUD CSP clean + favicon (`BUILD: 20261014-csp-favicon`):** Confirmed no inline `<script>` / `on*` handlers (external JS + `addEventListener` only). Console `sandbox eval code` + hash `sha256-ieoe…` is browser-extension noise, not the HUD. Added `/favicon.ico` + icon link (stops 404). `docs/` = `public/` . Hard-refresh: `https://alert.theleetclub.com/constellation-taxonomy-hud.html?v=20261014-csp-favicon` .
2026-10-14	**Constellation HUD Vendon + Workflow live pulls (`BUILD: 20261014-csp-favicon`):** Same-origin people-api proxies only. Machine panel **VENDON STATUS** / **WORKFLOW** / **REVENUE** from machines, red-flags snapshot, sales elapsed/summary, last-tx, live-dashboard snapshot, downtime, attendance/cleaning/tech maps + focused operator-schedule/tech-issues. file:// banner unchanged. `docs/` = `public/` (html+js).
2026-10-14	**Constellation HUD file:// guard (`BUILD: 20261014-file-guard+vendon`):** Detect `file://` / non-live hosts — never `fetch('/api/…')` (no session cookie / CORS). Large blocking banner with live HUD + login links; DEMO mock still renders. Live APIs on `alert.theleetclub.com` or local Vite/nginx (`localhost` / `127.0.0.1`). Visible BUILD stamp in status box; cache-bust `?v=` . `docs/` = `public/` (html+js).
2026-10-14	**Constellation HUD denser detail (`BUILD: detail-rich-20261014`):** Level-aware panel — Region/Brand/Area aggregates (machines, flagged, cleaning overdue, sum today KD, top-3 problem machines); Machine today/yest KD, operator+email, reasons, cleaningOverdue15h, hoursSinceCleaning, tier, last TX, area owner; Revenue full sales + top-5 products; Stock remote-credits proxy or not-in-API + live flags; Contract location_hours/owner/inactive. Hover tooltip (3–5 metrics) + scrollable detail drawer (amber/red crit). Workflow Assign unchanged. `docs/` = `public/` . Live: `https://alert.theleetclub.com/constellation-taxonomy-hud.html` after login; cache-bust `?v=` .
2026-10-14	**Constellation HUD rationale + decision/gamify cues:** PRODUCT-PROTOTYPE subsection (decision UX, gamified focus, Instagram-timing initiative, Alert ops prototype → future end-user). HUD adds focused vitals emphasis, ops-focus score from tier-1/overdue/flags, Prototype · Alert ops framing on the standalone page only.
2026-10-14	**Constellation taxonomy HUD (live):** Static page `/constellation-taxonomy-hud.html` — space map of Region→Brand→Area→Machine→Revenue/Stock/Contract using Alert fleet/sales/operator data; Workflow assign modal (GO CHECK / DM / cleaning-overdue). Not the fleet-ops pipeline mesh.
2026-09-29	**Technical service KPIs on Red Flags:** Response Time (avg `first_responded_at − created_at` , target <30m) + Planned Maintenance Ratio (PM÷(PM+CM), target >85%). API `GET /api/alert/workflow/technical-kpis` (Kuwait MTD). Workflow now exposes `first_responded_at` .
2026-09-29	**Session hang root cause:** people-api (`gunicorn` 1 worker, `--timeout 900`) was saturated — even `/health` and `/api/me` timed out (~10–15s+), so Alert stayed on **Checking your session…**. Restarted API; live command patched to **16 threads** / **120s timeout**; Dockerfile.api updated the same way. Auth gate also gets a **6s hard UI clear** (needs Alert image redeploy via Azure `dev` pipeline).

Date (UTC)	Summary
2026-09-29	**Session gate hang:** Refresh sometimes stuck on **Checking your session…** because `/api/me` had **no client timeout** and waited forever when people-api/ingress was saturated. Auth restore now aborts after **10s** and falls through to login.
2026-09-29	**Red Flags column rename: Trend → Technical** (header + composer). Inner Δ% mini-card keeps the % change label as **Δ%**. Email KPI check: Response Time (<30m) was blocked until Workflow shipped `first_responded_at` (now live — KPIs wired same day). Planned Maintenance Ratio formula ready; Live still ~all CM. See `PENDING-ALERT-INTEGRATION.md`.
2026-09-23	**Workflow technical issues proxy:** people-api exposes `GET /api/alert/workflow/technical-issues` (+ batch map) from Task Manager `vm-technical-issues` (open/in_progress). Connector handoff doc for other teams under `people-analytics-sync/docs/task-manager-api/CONNECTOR-HANDOFF.md`. Customer calls still not in Workflow package.
2026-09-14	**Products mix includes unnamed SKUs:** blank Vendon product names bucket as **Unknown Product** so mix KD sums to fleet actual (excl WEB). Cache reconcile also refreshes days where mix ≠ day total.
2026-09-04	**Operator Activity drops Clean:** Op Activity shows Refill / Credit / Door only. Cleaning stays on **Last clean** (avoids duplicate Clean stamps).
2026-09-02	**Vendon = source of truth for fleet KD:** Revenue cache is a speed layer only. WEB exclusion uses exact `WEB_CASHLESS`. Nightly + on-demand **reconcile** compares live Vendon day totals to cache and refreshes drift/gaps. Fleet bar shows a **verifying vs Vendon** cue when gaps/drift remain; `fleetYtdCacheTrusted` / `fleetRevenueCacheStatus` on daily-sales-elapsed.
2026-08-31	**Footfall Period A / B labels:** Date bar, comparison section, totals table, and charts use **Period A vs Period B**. KPI cards titled Period A only (with hint that A vs B is below).
2026-08-31	**Products Graph B focus location:** Dropdown uses selected Locations (not API payload), so it no longer goes empty while custom-range data is loading/refetching.
2026-08-31	**Footfall/Promo always dark ops:** Dark surface CSS no longer gated on shell Dark mode; Pro Light white panel overrides skipped for Footfall/Promo; removed Light-mode white restores.
2026-08-31	**Footfall Period vs Compare:** Report now loads Compare (B) dates; location detail shows **Period comparison** (totals Δ + daily/hourly charts). Compare bar hint points there.
2026-08-31	**Footfall/Promo white panels:** Toolbar/cards no longer inherit Pro `--panel: #fff`. Local dark ops tokens + hardcoded `.ffAlertToolbar` / compare bar backgrounds.
2026-08-31	**Promo + Footfall dark controls:** Date/select (including Footfall's disabled Period dates) stay dark in Chrome/Safari; heatmap/charts use dark palette unless Light mode; Footfall `--surface` no longer falls through to a blank/light fill.
2026-08-31	**Dark form chrome (cross-browser):** Stronger dark `color-scheme` + control fills for Classic dark / Pro dark / v2; WebKit date segments + calendar icon; autofill wash; Pro no longer forces `color-scheme: light` while in dark mode.
2026-08-30	**Revenue labels:** Products mix basis renamed **Actual revenue** | **+ WEB cashless** (was Customer only / Include cashless). Brief strip shows **Actual + WEB cashless = Total income** with mix bar. Fleet bar eyebrow = **Fleet actual revenue**. API `product-compare` returns `actualRevenueKd` / `webCashlessKd` / `totalIncomeKd`.
2026-08-28	

Date (UTC)	Summary
	Fleet bar + v2 minimize: Fleet revenue bar is full-width footer; side nav stops above it (no more under-nav hide). Alert v2 desktop sidebar has **minimize** (icons rail, persisted).
2026-08-28	**Sheet batch (tester notes):** Red Flags **Op. hours** column; toolbar **Sales ↓** + **Hide inactive** on Red Flags/Overall; Schedule live person = **operators + route/deliver drivers** only; night→morning **handoff prefers today's covering shift**; weekly report YoY totals use **daily sales cache** (not undercounting SKU mix); fleet KD vs Vendon portal gap = **WEB cashless** (Alert customer-only). Customer calls still stub.
2026-08-27	**QA history speed (exact, no gaps):** people-api shares one full QC scan per date window across machine popups (no per-chunk truncate); row cache + 4 workers. First open still does the SC scan; later machines/reopens in the same window are near-instant.
2026-08-27	**QA issue frequency hang:** Popup default history **90 days** (was 1 year); client aborts slow SafetyCulture history after **120s** with Retry; show latest-visit findings while history loads instead of endless "Scanning…".
2026-08-26	**QA Visit popup — issue frequency:** Fourth section lists SafetyCulture findings that **repeat across inspections** in the selected From/To range (count, first/last seen, tap a date to select that audit). One-off findings stay under a collapsed "Seen once" list.
2026-08-26	**QA Visit column blank:** Red Flags/Overall `/qa/summary` now uses a fast **45-day** SafetyCulture QC summary (cached) instead of a hung 180-day fleet scan that timed out and left every cell as —.
2026-08-24	**Sheet batch:** Products select-all locations/drinks (graph page 8); cashless Customer/Include toggle; Location fleet combined strip + fleet-wide combined line; nightshift attendance uses TM work date across midnight.
2026-08-22	**Products UX + fleet bar + auth:** Column hovers explain totals vs averages; product KD excludes remote credit (API re-seed + live vends filter); Graph B Top/Least scoped to focus location; fleet revenue bar stays horizontal with scroll on iPad; sign-out disables Google auto-select; fewer zero flashes on refresh.
2026-08-21	**Products hover + weekly PDF:** Chart/heatmap hover shows green/red up/down trend; PDF text sanitized (no letter-spacing glitches from Unicode); iPad opens report in a **new tab** instead of replacing Alert.
2026-08-21	**Products alignment:** Graph B location/products top-aligned grid; selected chips always under dropdowns (locations + products), no shift.
2026-08-21	**Fleet bar aligns to side nav edge:** Bar starts at sidebar right edge (not under, not over); full-height nav restored.
2026-08-21	**Fleet bar vs side nav (real fix):** Side nav stops above the fleet strip; bar is full-width `left:0` (no more under-nav overlap).
2026-08-21	**Fleet bar under-nav fix:** Portal to `document.body`; left = clear of fixed side nav (`!important`); drawer keeps rail inset.
2026-08-21	**Fleet bar left sync + heatmap dynamic labels:** Fleet bar left tracks `.mainColumn` (fixes under-nav); heatmap cell font scales with cell size.
2026-08-21	**Fleet bar + Location insights + Products polish:** Fleet KD rounded (no fractions), readable shrink + iPad, left inset clears side nav; Location KPI cards all open insight popups; paired main/prior glow; Graph A product targets always when set; Graph B toolbar side-by-side; mid-ellipsis axis/legend + full name on hover.

Date (UTC)	Summary
2026-08-21	**Products + fleet bar polish:** Rising/falling cups+Δ bolder with in-row motion; teal hover (clearer than white); legend hover glows main+prior lines; KD axis mid-side so it no longer overlaps legend; fleet bar full-size wrap, **no scroll**, ResizeObserver padding.
2026-08-21	**Fleet revenue bar responsive:** Wrap/stack on phone; MTD/YTD compact stacks; hide yest. cluster under 480px; taller safe padding.
2026-08-21	**Location YTD card + Red Flags fleet MTD/YTD + Products chart polish:** Location KPI **YTD vs last year**; fleet bar **MTD** / **YTD** with trends and short `HH:MM KWT · just now` stamp; Products prior=same color dashed, horizontal axis tooltip, label overflow fixes, rising/falling motion panels.
2026-08-20	**Performance Products layout polish:** Workspace bar (Time / Target / Y-axis) + per-graph cards; controls nested under A/B; shared B→C products; tighter type scale and muted labels.
2026-08-20	**Performance Products selection + heatmap UX:** Graph A requires an explicit product (no silent top-SKU title). Graph B requires focus location + products; Top/Least helpers kept. Target type “Both” no longer dumps machine KD onto Graph A (product targets only there; machine target on B). Y-axis scales to actual lines. Heatmap contrast + cell popup (KD/cups, prior, trend, short insight).
2026-08-20	**Performance Products A/B/C + PDF weekly report:** Graph A = one focus product across sites; Graph B = multi-product at a focus location; Graph C teal heatmap (machines × products by sales). Export → PDF (YoY, findings, up/down, machines/products — no issues / opportunities / recommendations). Revenue excludes WEB cashless / remote credit.
2026-08-20	**Sales revenue excludes remote credit:** Daily revenue cache + product hourly buckets skip WEB cashless vends so Products/report KD is customer sales only.
2026-08-20	**Performance Products UX rewrite:** Uncapped machine pick; Graph A pages 8 sites (‹ ›) for focus drink + pace strip; Graph B = products across all selected sites (hide when 1 SKU); Y-axis Revenue|Cups; time optgroups `single:*` / `compare:*`; dropped fleet mix / per-site cards / top-low.
2026-08-20	**Performance Products drop fleet-wide mix chart:** Graphs follow Locations pick (≤8). Rising/falling use selected sites. Top/low still ranks the whole fleet for a chosen drink.
2026-08-20	**Performance Products targets on same graph:** Dotted target pace lines overlay fleet / selected / per-site charts (no separate targets section). Cups | Revenue still switches Y-axis + targets.
2026-08-20	**Performance Products polish:** Last X date no longer clipped; single-day periods use **hourly** X; **Target unit** switch Cups | Revenue (product + machine targets).
2026-08-20	**Performance Products X-axis = dates:** Main product graphs use daily trajectories (dates on X like Location), not drinks/locations on X.
2026-08-17	**Performance Products — rising vs falling:** Five graphs on the same window (presets + custom range): fleet mix (all sites, no names), selected sites, per site, top/lowest 5 sites when a drink is picked (ignores Locations), Admin cup targets vs actual. Location graphs unchanged.
2026-08-17	**Performance Locations:** Also hide names starting with `*`. Location tab defaults to **All**; Products URL picks no longer seed Location selection.
2026-08-17	**Performance Locations cleanup:** Hide machines whose name starts with a digit. Products keeps its own site picks so returning to **Location** restores the prior selection (no longer stuck on 8).
2026-08-17	

Date (UTC)	Summary
	Performance Products guide trim: Removed crowded lead-in copy; kept short mix / fleet / promo steps only.
2026-08-17	**Performance Products How to use:** On-page recipe with why — one site = mix; 2–8 sites + one drink = fleet compare; a few drinks = promo check. Active step highlights from the current selection.
2026-08-17	**Performance Products graph cap = 8:** Dropdown and chart both use top **8** drinks (was “graph top 12” while the plot used 8). Table still lists the full mix. Location Trajectory 12-line pages unchanged.
2026-08-17	**Performance Products mix vs compare:** One location shows that site’s drink mix. Two or more locations compare those sites (no summed mix). Lens pills removed; selection picks the view.
2026-08-17	**Performance Products Select all = 8:** Opening Products / Select all checks the first 8 locations. **Now showing** states the graph: two sites + no drink filter = combined KD mix, top 12 bars, full table. Location-mode Select all still means the whole fleet.
2026-08-17	**Performance Products multi-select:** Clicking a location plots it (no longer requires Only). Check up to **8 locations** and **8 drinks**. Combined mix for several sites; grouped bars for several drinks across sites. Location-mode Select all unchanged.
2026-08-17	**Performance Products filters:** One Locations dropdown (shared with Location mode) + searchable Products dropdown. Click a drink bar to filter; drinks-in-site needs **Only** on one location. Location graphs unchanged.
2026-08-17	**Performance Location** | **Products:** Same tab switch. Location graphs unchanged. Products workspace compares drinks in one site or the same drink across selected locations (Today vs yesterday, WTD vs last week, month). Mix popup remains a shortcut.
2026-08-16	**Footfall live camera parity (hard rule):** Every Alert `calendar_days` report **re-reads** camera `people_in` on serve for the full Period (Today, WTD, custom) so As measured cannot drift from Monitor Total Visitors again; windows that include Kuwait today keep ~90s cache TTL.
2026-08-16	**Footfall Today = live visitors:** Single-day Kuwait Today re-reads camera `people_in` on each report serve (matches Monitor Total Visitors); short cache TTL; browser no longer keeps a multi-hour Today snapshot.
2026-08-16	**Footfall default = As measured:** Opens on camera-only view; Mirror & adjust is opt-in.
2026-08-16	**Footfall As measured = no mirror/unique labels:** Raw mode strips mirror metadata and unique-ratio; camera sites labeled **As measured**, no-camera sites show no footfall (not “Mirrored”).
2026-08-16	**Footfall fleet + Target graph parity:** Alert calendar Periods list O2/KU machines even with zero cups (no May proxy). Mirror & adjust matches target.theleetclub.com charts when selected.
2026-08-16	**Footfall cameras + no Jun proxy:** Mapped all 16 live Videoloft devices to Vendon IDs; Alert calendar Periods no longer substitute Proxy · Jun 2025 cups — empty sales stay empty (live Achievement still uses Vendon today/WTD).
2026-08-16	**Footfall KU Engineering camera:** Mapped Vendon `KU Enginnering` (375464) → Videoloft `KU engineering` (`1382465.34`); also KU CBA/Law/Shuwaikh. Normalize Enginnering↔Engineering in fuzzy match.
2026-08-16	**Footfall dates = user Period again:** Removed fixed May/Jul UI; heatmap/KPIs follow Alert presets; live Vendon for Achievement on the same Period. Warm cron still prebuilds weekly windows for cache hits.
2026-08-15	

Date (UTC)	Summary
	Footfall = Target hybrid: Fixed Jul/May reports from warm/DB cache; Alert presets only fetch live Vendon (today/WTD). Warm wait list includes KU Jul week; cache keys ignore `calendar_days` so cron hits match.
2026-08-15	**Footfall hang / empty ranges:** Primary-only report (skip May fallback + compare in build); empty `fallback_days` honored server-side; default preset WTD; surface build errors + Retry instead of infinite loading.
2026-08-15	**Footfall = Targets layout only:** Removed Targets/Full report split; left machine search + segment facets restored; Alert date presets stay.
2026-08-15	**Footfall date UX:** Period/Compare labels (not A/B); inclusive dates; clearer weekend live-sales note; Today on Fri–Sat snaps report to last business day.
2026-08-15	**Footfall = Alert dates + Admin targets:** Compare presets replace fixed Jul/May weeks; default footfall is as-measured (mirror/adjust opt-in); Admin → Targets override KPI / trajectory daily targets.
2026-08-13	**Footfall no white charts:** Heatmaps use dark split-areas; ECharts canvas stays `#0a0e14` in dark / v2; v2 Footfall no longer inherits Pro light `--panel`.
2026-08-13	**Footfall dark contrast:** Removed leftover white panels / dark-on-dark KPI text; location pills, explainer, export buttons, heatmaps, and metric colors follow Alert dark tokens.
2026-08-13	**Few-SKU Top/low:** If fewer than 10 distinct drinks sold in the window, popup shows one full ranked list (no fake Top 5 / Lowest 5). Split starts at 10+.
2026-08-12	**Top/low Today cache refresh:** Kuwait “today” product mix re-seeds ~every 10 min (was frozen after first early-morning pull). Popup shows mix snapshot time.
2026-08-12	**Top/low period + dates:** Popup shows Alert data window (preset label + Kuwait calendar range) and notes Vendon’s wider default range can differ.
2026-08-12	**Top/low no stale Lowest:** Empty `lowProducts` is respected (no singular `lowProduct` fallback); with ≤5 distinct drinks Lowest stays empty.
2026-08-12	**Top/low distinct drink count:** Popup shows how many distinct drinks sold in the period (explains short Top lists).
2026-08-12	**Top/low drinks disjoint:** Lowest list excludes Top SKUs; with ≤5 products sold, Lowest is empty (was mirroring Top). Blank cells = product-mix cache not warm yet.
2026-08-11	**Footfall CSS isolation:** Targets styles scoped under .alertFootfallRoot\ + lazy Footfall route so Red Flags/Overall ◀▶ scroll and chrome are not overridden.
2026-08-11	**Credits breakdown layout:** Label left, KD + event count right (no glued Custom refunds2).
2026-08-11	**Footfall dark = no white panels:** Replaced Targets light `#fff` / pale surfaces with Alert `--panel` tokens; charts use night chrome (`#0a0e14`) in dark mode.
2026-08-11	**Credits popup scroll + lost revenue hero; Footfall dark mode:** Credits sent modal uses scrollable `salesHistoryModal` and leads with **Est. lost revenue**. Footfall dark mode remaps light Targets surfaces and uses night chart palette.
2026-08-11	**Footfall tab + Credits insights:** New `/footfall` (and `/v2/footfall`) ports Leet Target Targets + Full report into Alert theme with **Adjusted** / **Raw camera** toggle. Red Flags **Credits sent** opens

Date (UTC)	Summary
	popup: WEB cashless categories, KD, est. non-revenue loss; API `GET /api/alert/remote-credits/machine-detail`. Ingress timeouts raised for long footfall builds.
2026-08-10	**Machine lookup everywhere:** Shared searchable machine pickers (`MachineIdSearchSelect` / `MachineMultiSearchSelect`) on Admin Machines (Vending machine), Targets (single + bulk), Promo (single + day targets), QA visit admin. Fleet toolbar search on Red Flags/Overall and QA/Performance location filters unchanged.
2026-08-10	**Product mix column tips:** Product mix popup adds / ? helpers for Day·Week·Month, KD, Prior, LY KD, YoY, Cups — hover on desktop, tap-to-pin on iPad (touch targets enlarged).
2026-08-10	**Product mix insights card:** Performance hero KPI row includes **Product mix → Open insights** (opens mix for the chart's lead machine; switch any location inside). Toolbar **Product mix…** remains.
2026-08-10	**Performance product mix UX:** Wider growth + product popups (readable KD tables). **Product mix…** on the Performance toolbar opens any machine (search inside the popup) — growth-compare rows are only a shortcut to that group.
2026-08-10	**Product mix = sales revenue:** Top/low drinks and Performance product popups rank by **KD sales** (not cups). Tables show KD / prior / YoY; cups stay as a secondary column. RF popup remains names-only.
2026-08-10	**Product mix completion:** Revenue cache now backfills `productCounts` for older days (seed re-runs when mix missing). Performance product popup live-fills day/week/month + YoY when cache is thin; Red Flags `/v2` Top/low drink opens names-only top 5 / lowest 5. Growth tables remain sortable.
2026-08-09	**Modal header clip fix:** Sticky header + panel transform clipped the first body line (e.g. "Last cleaning…" half-hidden). Headers are pinned outside the scroll area; body scrolls underneath.
2026-08-09	**Last clean media** / **CC dedupe:** Duplicate attachment links (same file from overlapping TM media fields) and a repeated Command Center footnote removed; same-type files numbered; High risk shown as a pill.
2026-08-09	**Alerts sheet gap-close:** Red Flags / Overall — machine search + highest-risk sort; downtime loss **5-min grace**; Last clean next window / days left; Last TX no-sales ≥4h highlight; `ALERT_TX_STALE_MINUTES` / `ALERT_NO_SALES_HOURS` env.
2026-08-09	**Last clean + all modals:** Last clean popup used a missing CSS class and modal section animations left `transform` on content (sticky/layout corruption). Fixed cleaning modal markup + opacity-only modal section animations for all salesHistory popups.
2026-08-09	**Top/low drink header fix:** Missing header cell for the new column shifted every column after Sales (wrong data under wrong headers). Header restored; column always visible on the Red Flags board (not picker-dependent).
2026-08-09	**Top/low drinks + Performance product mix:** Red Flags **Top** / **low drink** column shows highest/lowest SKU; tap → top 5 + lowest 5 names only (`vendon-sales-summary`). Performance: tap machine sales in growth popups (or single-location KPI) → product mix by day/week/month with cups, trends, YoY top 5; growth + product tables are sortable. API `GET /api/alert/performance/machine-products`.
2026-08-06	**Popup close stays pinned:** Modal header + × stick to the panel frame while scrolling (all salesHistory / contact / red-flags detail popups).

Date (UTC)	Summary
2026-08-06	**Downtime trend chip:** Dropped confusing `new` label (meant “vs 0 yesterday”). Table shows compact `+16m` and clips overflow inside the box; hover title explains “no downtime yesterday”.
2026-08-06	**Downtime trend % sanity:** Sub-minute yesterday was shown as `0m` while % used raw seconds (e.g. +133711%). Now show seconds under 1m; % only when baseline ≥60s, else absolute delta. Spoilage row always visible with waste status.
2026-08-06	**Downtime spoilage from Monitor waste:** Popup pulls today’s waste via the same path as Overall Waste % / Monitor waste tab (motion area-overrides − Vendon sales), converts cups × avg vend → KD for Spoilage impact.
2026-08-06	**Downtime popup clarity:** Hide Spoilage when not tracked (was always 0.00 KD — no inventory feed). Reference block shows day same-elapsed KD vs actual vends in the OFF clock window (often 0).
2026-08-06	**Downtime projected loss + today trend:** Zero-sales days no longer produce a 0 KD/h baseline (all-zero calculator). Baseline prefers yesterday with sales > 0, else recent positive days / live window; UI shows a clear “no baseline” note when none. Summary uses **same-elapsed** single-day compare; cell + popup show **today mins** and **trend % vs yesterday** (more downtime = red).
2026-08-03	**Downtime revenue-loss calculator:** Projected Loss = baseline hourly KD × downtime hours × peak multiplier (+ spoilage). Baseline = yesterday same-elapsed ÷ hours; Kuwait peak bands (off-peak ×0.35 … peak 09–14 ×1.9). Modal shows Revenue baseline / Opportunity / Spoilage / Final impact / Volume. Same-clock observed sales kept as reference.
2026-08-03	**Downtime loss = same clock hours:** Est. KD loss = actual sales on yesterday / day before / same weekday last week during the same Kuwait clock window as each OFF event (fallback: day rate).
2026-08-03	**Downtime popup:** Tap Downtime cell → events for Kuwait today (from→to, OFF type) plus estimated KD loss vs comparison days. Concurrent OFF types listed separately; today total merges overlaps.
2026-07-29	**Workflow write APIs wired:** GO CHECK creates urgent Received task; Call OP sends TM DM; cleaning alert can deliver cleaning-overdue to operator inbox; tech visit prefers Task Manager quality-control (SafetyCulture fallback). Daily-checks CC approve/reject samples + date-range still pending upstream.
2026-07-27	**QA/Tech columns blanked by Slack findings error:** Visit cells no longer show `!` when Slack issues-list fails but SafetyCulture data exists. Softened name matching; fleet operator-activity back to 14d (modals still 21d).
2026-07-27	**Admin Machines tech/QA save:** Vendon dropdowns always include full roster (suggested types + All users); keep assigned id on save even without days/hours; SQLAlchemy JSONB flag_modified so technician/QA/operator schedules persist. Tech Visit drink tests remain machine-level; on-site proof matches technician type or Admin-assigned name.
2026-07-26	**Downtime Yest. visible + inactive schedule + attendance:** Fixed stack/GO CHECK CSS clipping the Downtime Yest. box. Inactive rows use stronger amber hatch; Admin Machines: always inactive **or** weekdays/range/extra dates (Kuwait). Live Op / Tech Visit read 21d Attendance cache with modal self-fetch; tech proof matches technician type **or** Admin-assigned tech name.
2026-07-25	**Inactive shade + tech-only presence:** Inactive machines stay on Red Flags/Overall (shaded + Inactive chip). Tech Visit on-site proof uses Monitor attendance only when user_type is technician.
2026-07-25	**Downtime Today/Yest + overlap fix:** Compare baseline is period B (Today | Yest.), overlapping OFF types merged (no 90h “today”). GO CHECK column isolated so it no longer paints over

Date (UTC)	Summary
	Downtime. Owner box prefers **Area owners** person, then location tag. Live Op popup keeps workflow attendance and adds **Monitor physical location**. Admin Machines: active/inactive + Vendon dropdowns for operator/tech/QA schedules; Tech visit modal shows assigned tech + drink-test/presence proof.
2026-07-25	**QA Visit wrong SC site** / **PDF:** stop matching hospitals on shared department tokens alone (e.g. OPD linking Razi → Adan). Razi OPD/Old aliases split; PDF follows the correct audit.
2026-07-22	**GO CHECK only:** restore shared Call OP/AM `linkGo` sizing; GO CHECK uses dedicated `goCheckBtn` two-line label so it no longer spills into Downtime.
2026-07-20	**SX Loc-only + multi-product popup:** Red Flags SX cell shows location KD SX only; popup lists every Admin promoted product. Metric boxes center text.
2026-07-20	**SX boxes enlarged:** Loc/Prod SX cells use full sales-box height/width and matching type size (widen boxes; do not shrink text).
2026-07-20	**SX detail popup + bulk location targets:** SX cell opens comparison popup (windows, most/least SX pts + target % with dates); Performance via icon. SX boxes sized to fit. Admin → Targets: apply same location KD/cups to many machines without changing per-location products.
2026-07-19	**Downtime column (Red Flags + Overall):** Per-machine **Today** + **period cumulative** operational OFF time (`GET /api/alert/overall/downtime-summary`). Source = Vendon Machine OFF / KNet OFF / Vendon OFF; Admin cleaning windows subtracted. Period follows compare preset primary window. Sortable by period seconds.
2026-07-19	**Admin → Promo Vendon products:** Product dropdown loads on open (sample machine / fast fleet API) and refreshes when machine or owner changes — same catalog endpoint as Targets.
2026-07-19	**Promo Phase 1 on Alert:** New /**promo** and /**v2**/**promo** tab (daily achieved/remaining cup bars; default Americano Max). **Admin → Promo** for product assignment + calendar day targets + instruments (separate from Targets KD/SX). people-api aliases /api/alert/promo/assignments, /day-targets, /performance sharing arget_promo_* tables.
2026-07-18	**Performance growth KPIs clearer:** Big number is signed **Growth** (+/–%). Labels **vs prior period** / **vs same dates last year** (not “% of last year” — that implied full-year YTD). Index (period ÷ compare) stays as secondary.
2026-07-18	**Performance layout polish:** Locations is a compact top bar (no empty sidebar). PNG sits in the Trajectory header (not over the legend). Page ‹ › flank the chart left/right. **Mix machines** modal: Top6+Lowest6, ranks, search — combine any machines across pages without duplicate chips.
2026-07-17	**Performance dropdown names + legend arrows:** Locations dropdown shows location **names** (fixed empty labels). Removed duplicate series chip buttons; use the chart legend (line icons) with clearer **scroll** ‹ › for all series on the page, plus page ‹ › for the next 12 machines.
2026-07-17	**Performance names not IDs:** Fleet batches with `machineIds` were labeling charts with raw Vendon IDs (name map skipped). API resolves/caches Vendon names again; UI overlays names from `/api/alert/machines` . Locations dropdown shows **names only**.
2026-07-17	**Performance Trajectory UX:** Locations = searchable dropdown; Select all loads **all** machines via batched fleet fetches. Graph renamed **Performance Trajectory** — default All shows top **12** by sales with ‹ › pages; series chips toggle lines; **Customize graph** picks any ≤12 from full list. API `machineIds` batch size 30 / server max 120 per request.
2026-07-17	**Performance location cap 24→48:** Multi-select / API `machineIds` max raised to **48** (same as auto top-revenue load). Chart “All machines” still plots top **12** lines for readability.

Date (UTC)	Summary
2026-07-17	**Performance growth + combined line:** Growth KPI follows All/Top5/Lowest5 (by sales); click opens popup with all three groups + per-machine table. New **YoY growth** KPI (same dates last year) with the same popup. **Combined line** toggle sums shown machines into one trajectory.
2026-07-16	**Performance Overview (Classic `/performance`):** Top 5 / Lowest 5 ranked by **period sales KD** (not % of target). Hover tooltip: green/red **day Δ ▲/▼ +x%** and colored % of target. Same board on `/v2/performance`.
2026-07-15	**Performance target discoverability:** Clarified that sales-vs-target **graphs** are on `/performance` (not Red Flags tables). Status banner when fleet has sales but zero configured targets (Admin → Targets or weekly sheet).
2026-07-18	**Performance growth labels:** KPI boxes show **% of prior period** / **% of last year** (index) plus signed **Growth** (e.g. 98.8% → −1.2%). Compare modal shows both columns. Classic/Pro/`/v2` share the same board.
2026-07-15	**Alert v2 Classic boards for data+popups:** `/v2` Red Flags & Overall mount Classic pages with `variant=manus` (same APIs, cells, sales/trend/target/QA/cleaning/detail popups as `/`). Thin Manus-only tables removed from those routes. Classic/Pro untouched.
2026-07-15	**Alert v2 login full-bleed:** Login is edge-to-edge split (hero + sign-in rail), not a shrunk centered card; cancels body safe-area inset. Classic/Pro untouched.
2026-07-15	**Alert v2 login + iPad responsive:** Login redesigned (brand, adaptive Google button, card-first on tablet). Shell drawer through 1199px (iPad Pro landscape), KPI/filters/Performance stack on tablet; safe-area + overflow-x fixes. Classic/Pro untouched.
2026-07-15	**Alert v2 Classic parity pass:** Red Flags/Overall load the same enrichment APIs as Classic (incidents, last-tx, compare vendon/SX, attendance, cleaning). Rank uses `rankRows` (tier 1 critical first + freq mode from compare preset). Performance + QA Visit mount full Classic boards with `variant=manus`. Classic/Pro untouched.
2026-07-15	**Alert v2 scroll + metric boxes:** Workbook tables get ← → / drag pan, sticky machine column overlap fixes, and Manus mini metric boxes (sales/trend/SX/freq/target) matching Fleet Intelligence look. Classic/Pro untouched.
2026-07-15	**Alert v2 full workbook in Manus:** All Classic Red Flags / Overall / QA / Performance fields rendered as Manus data tables. No Classic Stitch/ops UI.
2026-07-15	**Alert v2 = Manus page layouts:** `/v2` Manus Fleet Intelligence chrome. Classic + Pro untouched.
2026-07-14	**QA Visit missing same-day SC audits (real root cause):** SafetyCulture `/audits/search` defaults to **order=asc + limit=100** and has **no `next_page_token`**. Code only fetched the oldest 100 audits per window, so **14 Jul KU CBA** (exact site label, match score 100) never entered the pipeline while older visits (1 Jul / 9 Jul) did. Fix: `order=desc`, `limit=1000`, cursor-paginate via `modified_before`. Fleet date filter uses **Asia/Kuwait** day from `lastVisitAt`.
2026-07-14	**QA Visit KU CBA / recent visits:** SC short site labels (e.g. `CBA` → `KU CBA`) now match. Scored location inspections count as QC even when officer ≠ Ismail. Alias map `config/qa_machine_aliases.json`. Busts QA caches. Fixes Alert showing 1 Jul while SC shows 14 Jul.
2026-07-14	**QA Visit freshness + matching:** SafetyCulture search now **globally sorts newest-first** before capping; last **14 days** of audits are fully processed (no truncating). Richer location keys (site + machine header fields), softer QC detect for scored inspections, shorter caches (~2–3 min). Fixes missing same-day / same-site reports and stale 2–3 day lag.

Date (UTC)	Summary
2026-07-14	**QA Visit freshness + same-site matching:** Visit timestamps prefer completed/modified over created (fixes “2–3 days old”). Date filters use **Asia/Kuwait** day bounds. SC search widens by `modified_at` pad so late finishes appear. Sibling machines at one site: exclusive best-match (no shared stolen visits). Shorter QA caches (~90s) + quicker client refetch.
2026-07-15	**Light / Dark for Classic + Pro:** Independent color mode toggle (Light · Dark) beside Classic · Pro. Tokens/fonts/surfaces follow `data-mode`. Defaults: Classic→dark, Pro→light until user picks.
2026-07-15	**Alert v2 at `/v2` :** New Manus fleet-intelligence shell (sidebar blurbs, breadcrumbs, LIVE, `/v2/login`). Classic + **Pro restored** (light iPad). Same production pages/APIs under `/v2/red-flags` etc.
2026-07-15	**Targets multi-product + insights + Performance filter:** Each promoted product keeps its own target (JSONB `flag_modified`). Fleet targets expand per location. `GET /api/alert/admin/target-insights` (5 min cache). Performance: Clear always + Only-this; Top/Lowest/All only when full fleet (or >5 selected).
2026-07-15	**Performance overview + speed:** Line trajectory (Top/Lowest 5 / All) · period presets · deficit / achievement / growth KPIs · fleet API uses revenue cache + `includeProducts=0` by default. Admin select chevrons / alignment tightened.
2026-07-14	**Admin → Targets tab:** Location KD + SX product + cups target moved out of Machines into a dedicated **Targets** section (fleet table + form). Multi-product from Vendon + cups/revenue metric.
2026-07-14	**Performance product multi charts:** Fleet API loads promoted-product cups; multi-select shows cups target vs actual, product ranking, daily + cumulative cups alongside location KD.
2026-07-14	**Performance graphs (Targets Areas parity):** Always-on multi chart grid — target vs actual, ranking, daily + cumulative · PNG export. Filter → KPIs → charts.
2026-07-14	**Performance multi-select graphs (Targets Areas style):** Location checkbox filter · Ranking / Compare / Aggregate chart modes · `GET /api/alert/performance/fleet`. Single machine still opens detail (product trajectory, SX, promo).
2026-07-14	**Performance charts (ECharts):** Replaced crude SVG bars with professional **Revenue Trajectory**, **Product Trajectory**, and **Day growth rates** charts (tooltips, stacked achieved/remaining, target line, dual growth lines).
2026-07-13	**CSP + Performance machines + Promo swipe:** Theme boot moved to `/theme-boot.js` (no inline script). Performance machine list falls back to Red Flags snapshot. **Promo instruments** on Performance (swipe deck + cup Δ vs yesterday); Admin → Area owners configures names. Area-owner/promo tables queried from people_analytics.
2026-07-13	**Performance + SX fix:** New `/performance` tab — Revenue Trajectory (Loc KD + product cups vs targets), growth table, SX KPIs. SX cell shows Loc/Prod amounts + pts; tap opens Performance for that machine. Admin: **target period** daily/weekly/monthly; default product **Americano Max**. API `GET /api/alert/performance/machine-detail`.
2026-07-13	**Op. activity compact + no metric ellipsis:** Stamp is `06 July 26 12:48` (Kuwait); column narrowed (~7.5rem). Metric % values no longer force `…` truncation (wider boxes).
2026-07-13	**Metric boxes contain text:** Frequency / Sales trend / YoY / SX no longer spill past box borders (`overflow: hidden` + ellipsis). Slightly wider stack boxes (4.5rem). Full value still on hover `title` where set.
2026-07-13	

Date (UTC)	Summary
	Table sticky Call OP/AM: Fixed Call OP clipped under Call AM while mid-scroll — sticky widths + `right` offset matched (fits Suhaib/Ahmed); AM paints above OP. Contained Op. activity / sticky label overflow with ellipsis.
2026-07-13	**Operator Activity — kind visible:** Last-touch cell shows **Clean** / **Refill** / **Credit** / **Door** on the cell (not hover-only), plus relative time + Kuwait date. Pro Red Flags + Overall cards show the same kind.
2026-07-13	**Operator Activity — single last touch:** Column shows only the **most recent** op activity (from cleaning / refill / remote credit / door) as relative time + Kuwait date. Hover shows which type.
2026-07-13	**Operator Activity — four last-touch lines:** Clean (Attendance & Cleaning end), Refill (Vendon All Products refilled), Credit (proven remote credit), Door (door opened). API `GET /api/alert/operator-activity`. Sort by newest of the four.
2026-07-13	**Pro fills the iPad (not a phone column):** Removed centered `1100px` shell. Full-bleed header/tabs/main on tablet. 4 KPI cols + 2–3 card cols from 768px up. Horizontal tab labels. Email hidden on tablet so Sign out never clips. Classic unchanged.
2026-07-13	**Pro iPad-native shell:** Full-width **tab strip** under brand (visible on iPad portrait/landscape; hamburger only <640px). **48px** touch targets, safe-area insets, **ProCompareChips** (large preset buttons), 2-col card grid on tablet, full-width card actions in portrait, sticky fleet bar with home-indicator padding. Classic unchanged.
2026-07-13	**Pro = dedicated iPad workspace (real refactor):** New `features/pro/` UI — card pages for Red Flags + Overall (not Classic Stitch chrome). Shared data/queries; Pro-only layout, KPIs, metrics, fleet bar. Shell stays top app bar. Classic unchanged.
2026-07-13	**Pro iPad readability:** High-contrast light tokens… *(superseded same day by dedicated Pro pages above)*.
2026-07-13	**Pro = light professional workspace (real layout):** Separate React shell — **top app bar** with brand + horizontal tabs (no sidebar), soft white cards, teal accents, Manrope. Classic keeps dark tactical sidebar Stitch. Toggle Classic · Pro.
2026-07-15	**QA Visit — reliability + co-located machines:** Location-only SC site visits now attribute to **all matching fleet machines** (siblings no longer starved by exclusive award). Title/header machine fields drive exclusive match. Default fleet range **90 days**; ingress **300s** timeout; partial SC scans surface **warning + Retry** (not silent empty).
2026-07-15	**QA Visit — SC pagination + errors:** people-api paginates SafetyCulture search at the real **100**/**page cap** (fixes missed recent visits in dense windows). Summary scan uses chunked windows. Fleet tab surfaces API errors instead of silent empty tables.
2026-07-13	~~Pro bold dark command~~ superseded same day — was still perceived as a skin; replaced by light professional shell above.
2026-07-13	**Fleet revenue labels (clarity):** Secondary strip labels **Yest. full day** (KD), **–2d full day** (KD amount for day-before-yesterday), **vs –2d** (%). Dropped stacked sub-labels that read like “no amount for –2d”.
2026-07-13	**Fleet revenue labels:** Secondary strip shows **Yesterday full day** KD, **Day before (–2d) full day** KD, and **Change (yest. vs –2d)** — mirrors primary/baseline/change so –2d amount is visible (was % only).
2026-07-12	

Date (UTC)	Summary
	UI themes Classic / Pro v2: Toggle in top bar + login (persisted). **Classic** = current tactical Stitch look. **Pro v2** = command-floor restyle (midnight steel, teal signal accents, Sora + IBM Plex Mono, glass top bar / fleet bar). Compare and pick; default remains Classic.
2026-07-10	**Fleet revenue — Yest. full day:** On Today vs Yesterday, the secondary strip compares **full yesterday vs full day-before (–2d)** from the revenue cache (not vs partial today). Label **vs –2d**. Main bar still uses same-elapsed today vs yesterday.
2026-07-10	**Sales Acceleration (SX):** New Red Flags column **SX** (Loc · Prod) — YoY-style lead pts + dual stack. Formula: growth = (cur–prev)/prev; SX = G_current – G_previous. Same compare presets as Sales. Admin: location daily KD target (overrides week default) + **SX product** name + **product cups/day** target. API: `GET /api/alert/overall/sales-acceleration`.
2026-07-10	**QA Visit sortable headers:** Fleet + inspection history use the same ⇅ / ▼ / ▲ column sort as Red Flags (click cycles desc → asc → clear). Sort dropdowns removed.
2026-07-10	**QA Visit tab polish:** Aligned filter bar + fleet/history tables. Machine search is a **searchable dropdown** (type to filter, pick to inspect / switch machine).
2026-07-09	**QA fleet dates — Red Flags fix:** `GET /api/alert/qa/summary` now includes **`latestByMachine`** (chunked SC scan + per-machine audit matching, same as machine workspace). Red Flags / Overall QA cells prefer this over stale `byLocationKey` rows (fixes Jan vs newer visit). Fleet endpoint uses the same matcher.
2026-07-09	**QA Visit fleet dates + latest fix:** Fleet tab shows **From**/**To** date filters (synced to machine drill-down). New `GET /api/alert/qa/fleet` returns latest SC visit per machine in range. Machine matching prefers **newest** visit, not stale exact-key row (fixes Jan vs June mismatch).
2026-07-08	**QA Visit tab:** New sidebar route **`/qa-visit`** — fleet overview + machine picker; full filters (dates, SC location, sort), week-vs-week trend, history table, findings, PDF.
2026-07-08	**QA history coverage + table pan:** Machine audit search walks ~**monthly SafetyCulture windows** so older months can appear. Modal default range **1 year**. Trend chart restored. Fleet tables: ◀ ▶ + drag-to-pan.
2026-07-08	**QA visit popup — history + trend:** Wider modal with **inspection history table** (date / location / officer / score / PDF). Filters: **from–to dates**, location search, sort by date or score. **Week-vs-week score trend** sparkline (improving / declining / stable). Tap a row to load that audit's findings + PDF. Carousel tabs scroll sideways on touch.
2026-07-01	**QC visits MTD = admin only:** Popup and cell badge count **Admin → QA visit** manual saves per machine (Kuwait month), not SafetyCulture inspection count. SC score/last visit/PDF unchanged.
2026-06-28	**GO CHECK — Slack DM:** Task Manager has no go-check write API; people-api sends **URGENT ACTION REQUIRED** to the scheduled operator via Slack DM (mailto fallback if Slack fails).
2026-05-21	**QA visit — SafetyCulture MTD + key findings:** Popup shows **QC visits MTD** (SafetyCulture audits in Kuwait calendar month). **Key findings** bullets: manual Admin summary first, else SC issue fields on latest audit, else AI/heuristic fallback. Cell shows MTD count badge when >0.
2026-07-01	**Last clean — Task Manager daily checks:** people-api reads `GET /api/v1/daily-checks` (+ detail by id) per Postman **Daily checks** group. Popup shows Workflow upload time, **CC** ✓ / **Pending CC** from `vm_review`, media links. Vendon snapshot still used when no daily check row exists.
2026-06-30	

Date (UTC)	Summary
	Last clean popup: Vendon snapshot timestamp only — removed internal “Workflow API not available” footnote when snapshot is shown. **CC** ✓ / **Pending CC** still appear once Task Manager exposes cleaning uploads.
2026-05-21	**Last clean — Workflow CC status:** Cleaning popup prefers Workflow upload timestamp when API available; **CC** ✓ (green) / **Pending CC** (red) pill when Command Center verification is returned. Comments + media links in popup. Until Workflow cleaning route ships, timestamp falls back to Vendon snapshot.
2026-06-26	**QA visit popup — monthly count:** Popup shows **Summaries this month** (Kuwait calendar month) with short description; count resets on the 1st. Admin tab unchanged.
2026-06-26	**QA visit — manual summaries:** Removed OpenAI bullet fetch from QA popup. New Admin tab **QA visit**: pick machine, enter bullet-formatted summary (validated); monthly save count per machine (Asia/Kuwait calendar month). Popup shows latest manual summary + SafetyCulture score/officer + PDF download.
2026-06-13	**QA visit score + AI summary + PDF:** QA column shows **score %** with green/amber/red chip. Popup: **3–5 bullet summary** from SafetyCulture report via **OpenAI** (`OPENAI_API_KEY` on people-api); **Download report (PDF)** proxied from SafetyCulture (no external SC link required).
2026-06-24	**Cleaning alert notifications (preview):** When last clean > **15h** (`cleaningOverdue15h`), **alert icon** on Last clean opens modal with contextual operator message for **Slack DM**, **Email**, **WhatsApp**, and **Workflow Received** (preview/copy only — no send from Alert).
2026-06-24	**Red Flags polish — operator, Last TX, fleet bar, sales popup:** Live operator — name in metric box + Late/Absent/Missing badge (no email/phone in grid); modal contacts are **icons only**; no snapshot name flash before Task Manager load. **Last** / **tx** — 3-line date/time (no in-box label); sort uses Vendon timestamp. Sales today popup — **That day (same time)** shows **—** when prior-day data missing (not 0.000). Fleet revenue bar — **Yesterday overall** + vs-today trend on Today vs Yesterday preset. Backend: not_scheduled pill **Missing**.
2026-06-23	**Red Flags operator + modals + Last TX:** Operator cell uses Task Manager name fallback; **one combined modal** (contact + attendance). Cleaning/tech visit popups use snapshot + SafetyCulture instead of Task Manager stub errors. Last TX Vendon fallback window **7 days**. Modal click-through blocked (`useAlertModal` guard).
2026-06-23	**Task Manager attendance (Overall): Attendance** column uses Task Manager via people-api — batch `GET /api/alert/workflow/machine-attendance-map` (5 min refresh) and tap → `GET /api/alert/workflow/operator-schedule` modal (operator, today status, clock in/out, absent/late MTD). Requires **`LEET_WORKFLOW_API_BASE`** + **`leet-workflow-api-key`** secret on people-analytics-api. Upstream docs: `people-analytics-sync/docs/task-manager-api/` .
2026-06-22	**Fleet revenue bar + Last tx + yesterday preset:** Running total bar uses full period labels (Today / Yesterday, etc.), **Change** column label, taller bar. **Last** / **tx** column renders in bordered metric box (64px, matches sales/freq cells). **Yesterday vs day before** sales stack shows trend when baseline comes from Vendon fallback (elapsed 0/null) or only baseline is present.
2026-06-21	**Preset sales + fleet revenue bar:** All compare presets merge elapsed + Vendon sales (yesterday vs –2d, today vs LW with Kuwait date math). Fixed **LW all zero** when elapsed empty but cache has data. **Fixed bottom bar** — fleet revenue total, baseline, ▲/▼ trend follows selected preset (Red Flags + Overall).
2026-06-21	**Red Flags — Last tx + popups + Call AM: Last** / **tx** column fills from Vendon `/last-transactions` when snapshot ISO is empty (same fallback as Overall). Trend popup — single

Date (UTC)	Summary
	open path via `.freqTrendOpen` button; row retarget only when `click` lands on `<tr>` (fixes double-fire). **Call AM** without Slack shows muted `linkGo` box + tooltip (missing user ID or team).
2026-06-21	**YoY % + Sales today trend:** MTD YoY cell leads with large **% change** (green/red); KWD amounts secondary. Sales today box restores visible ↑/↓ **trend %** (stronger size/weight in compact table CSS).
2026-06-21	**Last Transaction column restored:** Red Flags — dedicated **Last** / **tx** column (sortable; in All, Sales, Alerts presets); removed from Machine sub-line. Overall — **Last** / **tx** moved after Operator activity (Essential, Sales, Ops presets).
2026-06-21	**Popup fixes (iPad + trend + target owner):** Row tap uses capture-phase pointer target + synthetic click when Safari retargets to `<tr>` (Trend/Sales/Target/QA/cleaning/Call OP modals). Trend mini-card restores full ↑/↓ % visibility (no ellipsis clip). Target modal shows **full admin location owner** immediately (profile prefetch + API) with contact bar below.
2026-06-21	**Nav + sorting + modals + iPad taps:** Desktop sidebar always visible — **Icons** / **Labels** rail toggle only (full hide removed). **All valid table columns** sortable on Red Flags + Overall. Modals show row snapshot while API loads (target, cleaning, tech visit). **iPad/tablet:** pointerdown row guard + touch handlers so Trend, Sales, Target, QA, cleaning popups open reliably (no row detail stealing tap).
2026-06-21	**Target column + column composer:** Target **Left** KD no longer clips in table (wrap + wider box); tap opens full **WTD target modal** (`GET /api/alert/targets/machine-detail`) — daily target, today/yesterday %, remaining, WTD actual vs week target, prior-week trend, area owner contact. Column composer **expanded by default** on compact layouts; **Collapse** still available.
2026-06-20	**Ops surface system + column composer:** Unified inset cards (`ops-surfaces.css`) — KPI strip, compare bar, sales banner, column composer presets, alerts, machine cards share border/radius/background. Column composer in **opsToolStack** with compare. Interactive preset cards, bundle switches, column ribbon; per-user save via `/api/alert/me/ui-prefs` .
2026-06-19	**Operator Activity + sales sort:** Dedicated **Operator Activity** column (last WEB door open); **Sales today** and **Sales MTD** as separate sortable columns (high→low, toggle off on second click). Operator column = contact only. Red Flags + Overall.
2026-06-19	**PM roadmap completion:** Operator column shows **last WEB open** (relative) + email/phone; **Call OP** → `PersonContactModal` ; **QA** sort (latest/oldest) + **sales** sort (today + MTD cycle); cleaning **15h** banner + browser alerts + red-zone on cards/Overall; Overall **QA** cell opens report popup.
2026-06-18	**Compare preset — Yesterday vs Day Before:** Red Flags **Frequency** trend/sort uses yesterday vs day-before incidents (`daily-incidents-elapsed`); Overall **Sales** stack shows Yest. vs –2d. **Leet Workflow scaffold:** proxy routes on people-api (`/api/alert/workflow/*`); Red Flags modals for operator attendance, GO CHECK task, cleaning detail, tech visit, Call OP DM; QA popup bullet summary. Requires **`LEET_WORKFLOW_API_BASE`** for live workflow data.
2026-06-18	**Red Flags regressions: Call OP** tap opens **PersonContactModal** (email, phone, Slack, WhatsApp) with grey icon slots when data missing; **QA** SafetyCulture cache processes more audits, EU report links, improved QC/template matching; operator contact API enriches phone/WhatsApp from Vendon.
2026-06-13	**Red Flags — roadmap slice: Target** column (today % + remaining, WTD modal); **QA visit** column (SafetyCulture, tap for report); **operator last access** under live ops name; **cleaning >15h** row highlight; **sales today** column sort. APIs: `operatorLastAccessAt` / `dailyTarget` / `cleaningOverdue15h` on snapshot; `GET /api/alert/qa/summary` , `GET /api/alert/targets/machine-detail` .

Date (UTC)	Summary
2026-06-17	**Roadmap intake:** QA column (SafetyCulture parity), Target column (WTD + progress bars), cleaning 15h alerts, column sorting, operator last-access timestamp, QC report popup — see `ALERT-ROADMAP.md`.
2026-06-17	**Red Flags — Operator column:** Shows **live ops name only** (click for email, phone, Slack, WhatsApp). **Cleaning schedule label** (e.g. “half cleaning”) appears on a separate muted line with tooltip — it is the Admin cleaning-rule name, not a second person. Fixed **strike email** resolution (`operatorEmail` vs `strikeOperatorEmail` API mismatch) so Call OP and contact modals populate.
2026-06-13	**Column help:** Header labels are the help target — hover (PC) or tap (iPad) opens the popover; no visible **?** icon. `th` `title` kept as fallback. **Red Flags — Trend history:** Tap the **Trend** mini-card opens **today vs prior days** (same elapsed Kuwait clock) with trend %; respects compare preset (calendar days, same weekday chain, or WTD baselines). API: `GET /api/alert/red-flags/daily-incidents-elapsed`.
2026-06-10	**Table headers:** Two-line grid (main + sub) so Red Flags / Overall column titles align consistently. **Overall — Peak hour:** From Vendon daily revenue cache (Kuwait busiest hour + vend count); API seeds today’s cache on first load.
2026-06-10	**Overall — Sales history popup:** Tap sales opens **today vs each prior day** (same elapsed Kuwait clock) — today vs yesterday, today vs 2 days ago, etc., each with trend %; table cell still shows today vs yesterday stack.
2026-06-11	**Adaptive ops layouts:** Red Flags **Cards** view on iPad (toggle to Table). Overall **Essential** columns on iPad (8 cols) + **All columns** toggle. Overall table typography aligned with Red Flags (`opsFleetTable`). Sticky machine column on horizontal scroll.
2026-06-11	**iPad** / **touch UX:** Nav drawer on all viewports ≤1366px **and** touch-first devices (fixes sidebar stuck open on some iPads). Column help via tap **?** (`InfoTip`) instead of hover-only tooltips. **Red Flags row detail** — structured sheet (why flagged, sales, credits, frequency, people, Go check). Larger tablet typography.
2026-06-10	**API fix:** `alert_routes` cache used `datetime.time` instead of `time.monotonic()` — broke remote-credits, daily-sales, and caused 503s. **Stitch v2** export applied (tactical tokens, table panel headers).
2026-06-10	**Red Flags** / **Overall dashboards:** Unified Stitch ops panel — KPI strip, compact controls, responsive table scroll, inline SVG nav icons (CSP-safe). Replaces mixed legacy cards on Overall.
2026-06-10	**Stitch design system:** Applied Google Stitch export (`docs/stitch-export/`) — Inter + Space Mono, Dark Ops tokens, icon sidebar, Kuwait clock top bar, table headers. Real data/API unchanged.
2026-06-10	**iPad** / **tablet layout:** Drawer nav only on **phones (≤767px)** — iPad portrait keeps fixed sidebar. Safe-area padding, **44px** touch targets, tablet typography on Red Flags / Overall tables (768–1194px).
2026-06-10	**Auth** / **session:** Ingress routes `/api` on `alert.theleetclub.com` to people-api (first-party cookies, same as Monitor v2). SPA waits for `/api/me` before showing login; Google **auto_select** when session expired but Google account active.
2026-06-10	**Responsive shell:** Sidebar **auto-hides** on **phones** (≤767px) — **Menu** in top bar opens off-canvas nav + backdrop; iPad and desktop keep fixed sidebar. **Red Flags** / **Overall tables:** Short uppercase headers (full text in tooltips), **horizontal scroll** instead of vertical letter-wrapping.

Date (UTC)	Summary
	Overall — Sales: `GET /api/alert/overall/daily-sales-elapsed` — today KWD through page load vs yesterday same clock window (Kuwait).
2026-05-08	**Red Flags — Vendon KPI columns: Send credit** (remote credits sent today): ≤5 green · ≤10 orange · >10 red. **Test credits** (dispense tests): ≤6 green · >6 red. **Vends resolved:** last failed vend today vs nearest remote credit — ≤5 min green · >5 min red · no fail green · unknown grey (`people-api` `compute_vends_resolved_for_machine` + optional `machines` on `today-totals`). **Last cleaning:** snapshot time + Admin **cleaning windows** — on schedule green · outside orange · no cleaning today red (shared `kuwaitCleaningStatus` with Overall).
2026-05-08	**Admin — Machines layout:** `adminCardMachineProfile` — Core `repeat(3, minmax(12rem, 1fr))` + `min-height: 40px` on selects/inputs so labels line up and dropdown text does not clip; **Operating days** in `adminOperatingDaysBlock` (caption row + radios); **Remove** on cleaning/ operator/staff hour rows uses `adminTimePairActionCell` + invisible `adminFieldCaptionSpacer` so the button lines up with time inputs; technician intro shortened to one line.
2026-05-08	**Overall — People Count** / **Footfall:** `GET /api/alert/overall/people-footfall` sums `people_in` (daily Videoloft buckets) from `people_analytics_records` for Kuwait **today vs yesterday**; resolves cameras with the same embedded map as Monitor v1 `peopleCameraToMachineMap` , optional `alert_people_camera_map.json` / `ALERT_PEOPLE_CAMERA_MAP_JSON` , cached Videoloft device list, optional `ALERT_PEOPLE_FUZZY_MATCH` .
2026-05-07	**Overall:** No **Fleet table** subheading (count badge only). **Compact column headers** (short label + full title/note on hover), tighter spacing. **Admin · Location hours** + snapshot columns + Vendon fallback as before.
2026-05-07	**Red Flags — Today** / **Trend:** Three icon boxes — **Score** & **Gap** values use **green** at zero burden and **tiered red** by incident count; **Trend** uses Δ% with **tiered red** on bad uptrends. **Gap** shows `↓0` (at green) or `↓N` (must **drop** N incidents to reach green); `–` if unknown. Header subcopy **gap ↓ to green**. Tooltips spell out direction vs baseline.
2026-05-07	**Tables — text overflow:** Removed global `nowrap` on desktop table cells; `overflow-wrap` / `word-break` on all `th` / `td` so long machine names, emails, and alert text wrap inside cells instead of spilling past the table. Red Flags frequency mini-cards allow trend/ratio lines to wrap when narrow. Optional utility `.tableCellNoWrap` for rare single-line metrics.
2026-05-07	**Responsive UI:** Sidebar collapses to a **top horizontal nav** on mobile/tablet; page containers widened on desktop (`pageShell` / `pageShellWide`). Tables now wrap on small screens (less forced horizontal scroll), with tighter cell padding + fonts under 900px/720px.
2026-05-07	**Red Flags — Frequency column:** Wider column reserved on the table (**~14rem** min) so three mini-cards keep **readable type** (clamp up to v1 ~11px counts / 9px trends); **card height** restored (~46px). Badges can wrap to two lines (**VEND FAIL**).
2026-05-07	**Red Flags — Frequency column:** Restored **Monitor v1** layout — three compact mini-cards (**STALE** · **OFF** · **VEND FAIL**): baseline count on top (e.g. `8/13`), **trend %** under an inner divider (↑ red / ↓ green / flat grey). Header title **Frequency** + per-mode subtitle. Cells sized tighter than legacy defaults for fit.
2026-05-06	**Red Flags: Call OP** / **Call AM** columns (Slack DM when `SLACK_*` ids configured; AM resolved from AM Plan location buckets; OP uses strike email → optional Slack user map, else mailto). Placeholder KPI columns show **?**. **Overall: ?** + hover for disconnected metrics. **Admin:** catalog vs saved profile counts at top.
2026-05-06	

Date (UTC)	Summary
	Red Flags board: “Send Credit” → **Credits Sent** + new **Dispense Tests** (same criteria as Monitor drink tests). Earlier experiment: Score / Trend / Gap triplet — **superseded** by per-case Frequency mini-cards aligned with Monitor v1. **Overall:** Operating Hours now shows **hours only** (tag displayed separately) and Admin “Saved profiles” moved below the editor.
2026-05-06	**Fleet tags:** API adds `vendon_tag_source` ; Admin explains **how the tag was derived** (feed field / group / name parse). **Removed** sidebar **Documentation map** + Red Flags **xlsx/docs** UI copy. **Machines** / **Advanced** tables: **bounded scroll**, sticky header, wrapped cells. Prior Admin machine-profile row editor + machine tag column behavior unchanged.
2026-05-05	**Admin → Location owner:** Vendon **`prose`** / **`callInCode`** , **split machine** **`name`** on `| / –` for fleet codes; no **`/location`** names in tag datalist; API validates tags only; UI **does not prefill** legacy DB site text — hint when Vendon has no tag.
2026-05-02	**Who can use Alert** — org email domain allowlist (server + UI); **leetAlertAdmin** can save access rules. Red Alert / machine **location** text prefers Vendon **tags** and machine tag fields before the generic Vendon `location` string (aligns with Admin “location owner” / machine tag).
2026-05-04	**Red Flags** = **xlsx** column order (through **Tech Visit**); `alert.theleetclub.com.xlsx` in repo; `redFlagsWorkbookColumns.ts` ; placeholders for columns not in snapshot; machine / alert split; **Admin** tag/priority (other row).
2026-05-02	**Timespan presets** (Today VS Yesterday default, +4) on Red Flags & Overall; Admin = data not on Vendon; five **figure SVGs** + PDF; Red Flags = Monitor Red Alert style.
2026-05-01	**Who can use Alert** steps; Machines vs workbook Admin; PO doc + PDF raster.
2026-04-30	Home hub; team access in Admin.
